I have not yet started designing a panel layout.

Up to this point, I'm quite convinced to use the [Garmin G3X touch system](#) for my main instruments.

Going for a dual screen setup with dual garmin autopilot installed. (Configured with 2 GSA 28 integrated servos for pitch and roll autopilot)

With 2 displays, you can configure your panel to provide more information in the least amount of space. Seamlessly integrate two 10.6-inch displays. Configure 1 display as a split PFD and MFD, and the other as a dedicated display for a variety of features, including traffic, geo-referenced charts or engine information. A cobnfiguration like this also offers full backup capability in case one display fails.

Each G3X Touch system comes with :

- 1 or more displays (with or without SiriusXM weather capability)
- Air Data, Attitude and Heading Reference System (ADAHRS) sensors
- Magnetometer, which determines the aircraft's magnetic heading
- Outside air temperature probe
- Engine Indication System (EIS) interface with [engine sensor kits](#)
-

The G3X Touch comes equipped to take advantage of Connex, which is a network link and in-cockpit wireless connectivity system which can connect a mobile device to your flight system.

It shows engine parameters, moving map, PFD, ND and drives the autopilot servo's.

Some video sampling the G3X at Sun'n Fun [here](#).

Another full scope G3X flight solutions video presentation by Garmin [here](#)

So far, I already purchased the following components related to the instrument panel :

- VERTICAL POWER VP-X-P PRO with connector kit
- throttle quadrant
- magnetic compass
- starter contacts
- TRIG TT22 XPDR W/ 4FT WIRE HARNESS
- COMANT CI-105 DME XPDR ANTENNA
- Altimeter from Vans
- HSI from Vans
- RAC STICK GRIP G407 and RAC G401
- toggle switches with colored covers
- COMANT CI-122 VHF COMM ANTENNA BNC
